

S110 / S120

The practical machines
for your specific grinding solution.

Key data

The S110/S120 are very flexible internal cylindrical grinding machines for machining medium-sized workpieces.

The S110 has a centre height of 102 mm and a grinding length of max. 120 mm.

The S120 has a centre height of 150 mm (220 mm) and a grinding length of max. 150 mm.

Fritz Studer AG

The name STUDER stands for more than 100 years of experience in the development and production of precision cylindrical grinding machines. «The Art of Grinding.» is our passion, highest precision is our aim and top Swiss quality is our benchmark.

Our product line includes both standard machines, as well as complex system solutions in high-precision cylindrical grinding for machining small and medium-sized workpieces. In addition we offer software, system integration and a wide range of services. As well as receiving a complete tailor-made solution the customer also benefits from our 100 years of know-how in relation to the grinding process.

Our customers include companies from the machine tool industry, automotive engineering, tool and die makers, the aerospace industry, pneumatics/hydraulics, electronics/electrical engineering, medical technology, the watch industry and job order production. They value maximum precision, safety, productivity and longevity. 22 000 manufactured and delivered systems make us the market leader and are clear evidence of our technological leadership in universal, external, internal and noncircular grinding. Around 800 employees, including 75 apprentices, make it their goal every day to ensure that «The Art of Grinding.» will continue to be closely linked to the name STUDER in the future.

S110

S120

If you are looking for a compact machine for internal grinding, the S110 / S120 are a very good choice. Thanks to their small installation space they will fit into any workshop. The S110 / S120 can be configured very flexibly to your requirements and so increase your productivity. Up to three linearly arranged grinding spindles enable external and internal grinding in a single clamping.

Characteristics

Dimensions

S110

- Height of centres 102 mm (4")
- Grinding length max. 120 mm (4.7") (1 spindle)
- Length of parts max. 230 mm (9")

S120

- Height of centres 150 mm (5.9")
- Grinding length max. 150 mm (5.9") (1 spindle)
- Length of parts max. 650 mm (25.6")

Hardware

- Up to three HF grinding spindles in a linear arrangement
- HF or belt-driven spindles
- A grinding spindle can be equipped with an external grinding wheel dia. 300 mm (12")
- External and internal grinding are possible in a single clamping
- Full enclosure with sliding door
- Integrated or autonomous loading systems
- Fanuc 0i-TD / Fanuc 31i-A (with loader)

Software

- StuderWIN or StuderSIM simulation software for the creation and simulation of grinding programs on the machine control or on a PC

Your advantages

- Small space requirement
- Optimal accessibility
- Low unit costs
- High flexibility
- Simple operation
- Low maintenance costs

Unique worldwide

The other very compact machine concept. The workpiece is moved on the cross-slide, while the grinding spindles are mounted in a fixed position on the base of the machine. This guarantees stability, offers good accessibility for set-up or workpiece change, and is easily automatable.

The spindle set-up, with up to 3 HF grinding spindles in a linear arrangement, can be optimally designed to meet customer requirements.

The ideal machine for chuck applications for individual components up to small-batch production. A cost-effective solution for high-precision automated grinding can be achieved with the optional, fully integrated automatic loading and unloading system.

- Compact and user-friendly
- Up to three HF grinding spindles in a linear arrangement
- Large selection of internal and external spindles (external wheel up to dia 300 mm (12"))
- C axis for the workhead enabling form and thread grinding
- Manual A axis for precise thread grinding
- Various dressing options
- Full enclosure with sliding door
- Integrated or autonomous loading systems
- Measuring probe
- StuderSIM offline simulation software
- Dovetailed work table for simple positioning of the grinding spindles (optional)
- CNC-controlled Y-axis (vertical)
- Wide range of clamping devices and accessories
- Standardized interface for loader and peripheral devices

Machine bed

1

The machine bed, comprising of gray cast iron, is cast from a single piece and forms the base for mounting the high-precision cross slide table and the grinding spindle mounting block. The support of the guides for the X axis is cast directly into the machine base. The remaining area on the upper part of the machine base conveys the coolant around the base back into the coolant unit or the coolant cleaning unit, via a coolant tank.

- High geometrical traverse precision
- Effective covering of the guideways

X and Z axis

2

The generously dimensioned cross slide is manufactured from quality cast iron. Ground and pretensioned high-precision linear bearings (rollers) are used for the longitudinal and cross slides. The feed is provided via ground recirculating ball screws with pretensioned, backlash-free double nut. The guides and recirculating ball screws have an integrated central lubricating system. The X axis is effectively covered by bellows. The Z axis is covered by integrated bellows on both sides. The linear glass scales are protected against contamination by purge air and in addition also by guards. The drive motor (AC servo motor) with direct drive is also completely covered by a guard plate.

Grinding spindle support/Grinding spindle arrangement

1

2

3

4

The modular grinding spindle support concept enables optimal adaptation to the respective grinding task. The grinding spindle supports comprise of permanently bolted on solid mounting blocks, either in a single or twin version, depending on the requirements. One, two or three spindles in a linear arrangement can be used in the basic configuration. The use of up to three spindles is possible depending on the specific geometrical situation. In the case of two or three grinding spindles the maximum

possible grinding length is restricted. This diversity of spindle arrangements enables optimal adaptation to your process requirement. For speeds in the upper rpm range up to 120 000 rpm, HF Spindles with an integrated internal cooling circuit can be used. Maximum spindle diameter is 120 mm (4.7"). Smaller diameters up to 45 mm can be used either with the appropriate spindle holder or a reduction sleeve.

1 X and Z axis arrangement

2 1 spindle

3 2 Spindles in linear arrangement

4 3 Spindles in linear arrangement

- Large selection of grinding spindles
- External and internal grinding in a single clamping

Workhead

The high-precision workhead is equipped with special bearings and guarantees the highest roundness accuracy. The spindle nose complies to the DIN/ISO 702-1 standard.

A high-precision C axis, with direct measuring system on the workhead spindle, is available for form and thread grinding.

- High roundness accuracy
- Low-maintenance
- Air lift

Fixed or swivelling Work table

Cones and tapers can be machined in two ways. Either by using a swivelling work table with a manually adjustable range of up to 21 deg (31 deg for S110) or with a fixed table and an appropriately dressed conical grinding wheel.

Sensor technology/Measuring probe

1

2

3

- Air-gap elimination
- Set-up assistance
- Process reliability
- Process optimization

STUDER attaches great importance to optimized grinding processes. Sensor technology plays a significant role here, especially in internal grinding. Three main goals are pursued:

- Air-gap elimination for cycle time reduction
- Process monitoring during grinding and dressing
- Simple registration of grinding wheel and workpiece

With small bore diameters it is particularly difficult to obtain a contact signal. STUDER achieves the best result with a ring sensor consisting of a revolving transmitter ring and a fixed receiver ring. The signal transmission between the two rings is contact-free.

The measuring probe is used for the following operations:

- Length positioning
- Measurement of uninterrupted internal and external diameters for tool compensation when using non-dressable grinding wheels
- Process monitoring on machines with loader

Dressing

1

2

3

4

The wide variety of dressing options enables optimal adaptation of the machine to the most diverse applications and workpiece requirements. In addition to fixed dressing units, devices for rotating dressing tools can also be mounted. The latter are especially suitable for dressing ceramic-bonded

CBN grinding wheels. In combination with the acoustic touch sensor technology, a precisely defined, minimal amount can be dressed using the Touch-Dressing method. The grinding wheel loss through dressing is thus minimized.

Dressing unit

The dressing unit is mounted on a hydraulically actuated precision slide with 100 mm (4") stroke.

Machine control and operation

1

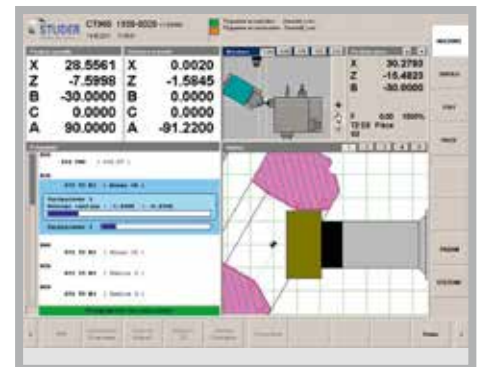

- PCU manual control unit
- EMC-tested control cabinet
- Ergonomically arranged controls

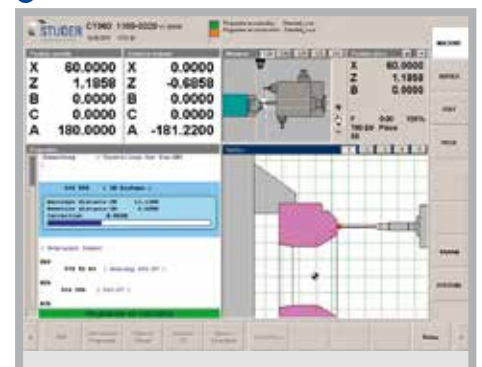

The Fanuc 0i-TD CNC control with active flat color touch screen (15") can be used for a wide variety of grinding tasks. For particularly demanding applications, such as high-precision form or thread grinding, for example, or in the case of machines with integrated STUDER loader, the Fanuc 31i-A is available. Both control units are extremely reliable and optimally tuned to the drive elements. The layout of the elements complies with the relevant safety standards and is EMC-tested. All controls are clearly and

ergonomically arranged. An important role is played by the manual control unit, which facilitates setup close to the grinding process. A special function – the Sensitron electronic contact detection device – reduces downtimes to a minimum.

2

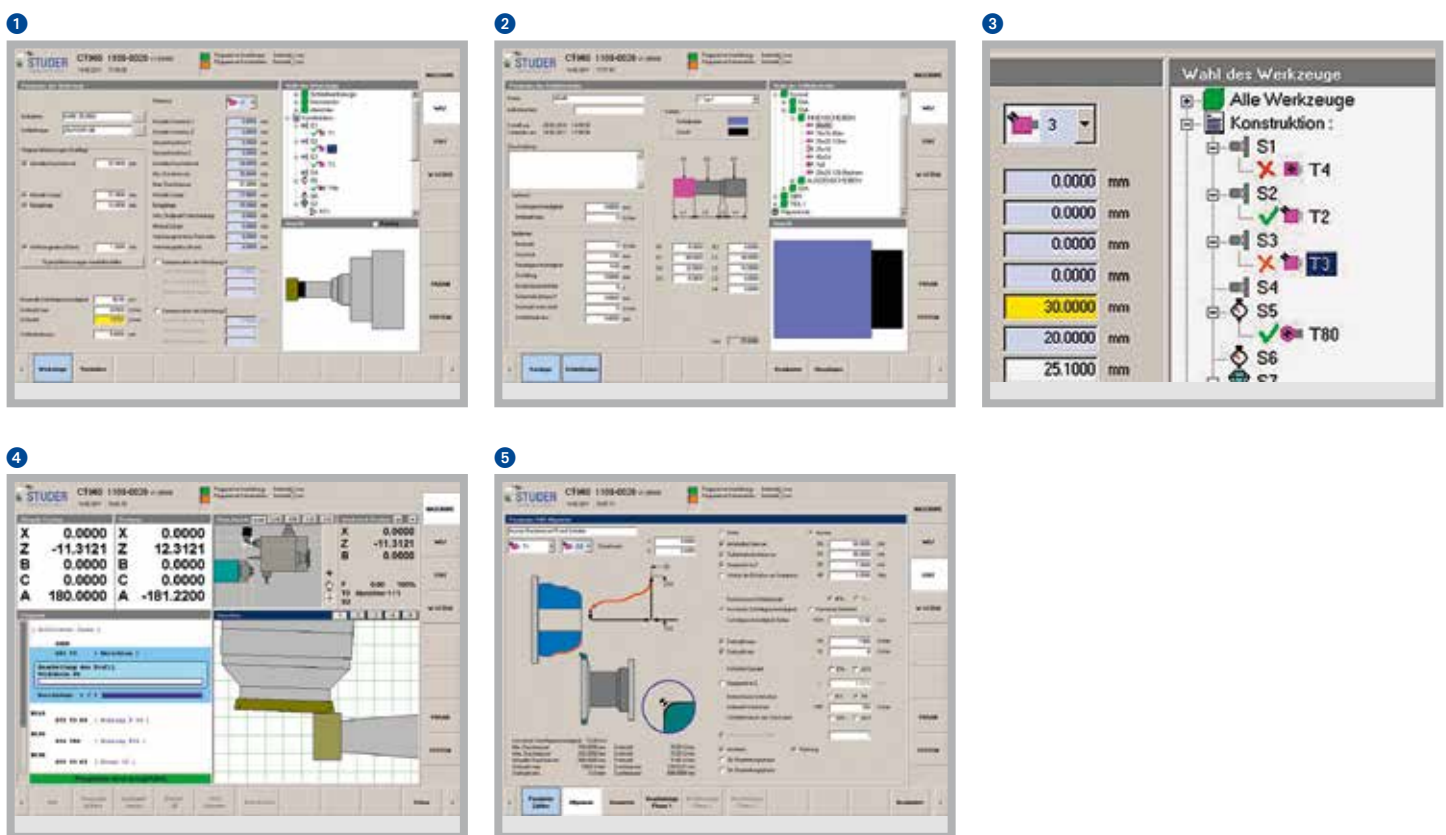

3

- 1 Fanuc 0i-TD
- 2 Main screen with simulation
- 3 Use of the measuring probe

The StuderSIM/StuderWIN operating system

Two different operating systems are available, StuderSIM and StuderWIN. Both operating systems are suitable for a wide variety of internal grinding applications and enable reliable programming of all basic cycles for grinding, dressing and process-supporting measurement. The basic cycles such as face grinding, bore grinding, taper grinding, thread grinding, dressing and gauging are defined in the Parameter Input window. This type of programming

provides great flexibility, while remaining very user-friendly and workshop-oriented. Each cycle is equipped with a dynamic help system, which guides the operator through the grinding data creation process. After programming, the process can be simulated (StuderSIM) and optimized. This ensures reliability, as well as guaranteeing short programming times and increased cost effectiveness.

- 1 Tool management
- 2 Grinding tool catalog
- 3 Tool set-up status

- 4 Dressing simulation
- 5 Grinding data input window

Automation

1

2

- Automatic production processes
- Integrated quality control
- Standardized loader interfaces

Loading systems are available for the STUDER S110/S120, which can be precisely adapted to the machine application and the machining processes thanks to their modular design. Appropriate peripheral units guarantee seamless integration into the respective production process. The handling systems communicate with the machine via the standardized loader interface

3

and enable even complex handling tasks to be solved. Comprehensive quality control is possible during the grinding process. This means: gauging, post-process gauging, recording, evaluation and correction.

Integrated loading systems

For medium-sized and small series STUDER offers integrated loading systems, to increase efficiency and flexibility. These cost-effective loaders can be reset extremely quickly and have the advantage that they are controlled from the machine control.

4

Two different peripheral systems are available:

- Two conveyor belts, the height and width of the loading belt is adjustable, enabling very quick changeover from one workpiece to the next.
- Pallets 410 x 400 mm (16.1" x 15.7"), autonomy without operator intervention is two pallets. One pallet can be changed without having to interrupt the machining process.

The maximum workpiece size for both systems is: diameter 60 mm (2.4"), length 80 mm (3.1"). Maximum workpiece weight 1 kg (2.2 lbs).

Customer Care

STUDER cylindrical grinding machines should fulfil the customer's requirements for as long as possible, work cost-effectively, function reliably and be available at all times. From «start up» through to «retrofit» – our Customer Care is there for you throughout the working life of your machine. 30 professional helplines and more than 60 service technicians are available in your area, wherever you are in the world.

- We will provide you with fast, uncomplicated support.
- We will help to increase your productivity.
- We work professionally, reliably and transparently.
- We will provide a professional solution to your problems.
